# THP (B-2): sc-271022

## BACKGROUND

Tamm-Horsfall glycoprotein (also referred to as uromodulin or THP) is the most abundant protein found in normal urine. THP is expressed on the luminal surface of the membrane with the glycosyl phosphatidylinositol (GPI) anchor and excreted in urine at a rate of 50-100 mg per day. THP, uropontin and nephrocalcin are the three known urinary glycoproteins that affect the formation of calcium-containing kidney stones. THP is synthesized by kidney epithelial cells and is believed to play important and diverse roles in the urinary system, including renal water balance, immunosuppression, urinary stone formation and inhibition of bacterial adhesion. THP is nontoxic and blocks early events required for normal T cell proliferation in vitro. The gene which encodes THP and is a candidate gene for nephrolithiasis maps to human chromosome 16p12.3.

## CHROMOSOMAL LOCATION

Genetic locus: UMOD (human) mapping to 16p12.3; Umod (mouse) mapping to 7 F2.

## SOURCE

THP (B-2) is a mouse monoclonal antibody raised against amino acids 291-425 of THP of human origin.
