**BACKGROUND**

The second messenger cyclic AMP mediates diverse cellular responses to external signals such as proliferation, ion transport, regulation of metabolism and gene transcription by activation of the cAMP-dependent protein kinase (cAPK or PKA). Activation of PKA occurs when cAMP binds to the catalytic subunits of the tetrameric PKA holoenzyme resulting in release of active catalytic subunits. One of several regulatory subunits, p-PKA II, also known as PRKAR2B, is a 418 amino acid protein that is phosphorylated by the activated catalytic chain. p-PKA II regulates PKA II knockout mice that exhibit obesity and fatty livers, as well as markedly reduced leptin mRNA. Also playing a role in the immune response, p-PKA II suppresses CREB transcriptional activity and down-regulates IL-2 production in T lymphocytes.
