CRABP-II siRNA (h): sc-35105

BACKGROUND

The cellular retinoic acid-binding protein (CRABP)-I and a related isoform CRABP-II are nuclear receptors for retinoic acid (RA), an important regulator of cell growth and differentiation in fetal and adult tissues. These CRABP proteins mediate the downstream effects of RA in distinct ways. CRABP-I negatively regulates the activity of RA by enhancing the production of RA-metabolizing enzymes and increasing the rate at which RA is degraded. CRABP-II enhances the effects of RA by directly interacting with RA receptors (RAR) and, in turn, promoting the formation of RAR-RA complexes and stimulating RA-mediated gene transcription. Both CRABP-I and CRABP-II are expressed in the embryo, and CRABP-I is ubiquitously expressed in various adult tissues. The expression of CRABP-II is elevated in cells that synthesize relatively large amounts of RA, and it is also predominantly expressed in skin, uterus, ovary and in the choroid plexus.

Genetic locus: CRABP2 (human) mapping to 1q23.1.

PRODUCT

CRABP-II siRNA (h) is a pool of 3 target-specific 19-25 nt siRNAs designed to knock down gene expression. Each vial contains 3.3 nmol of lyophilized siRNA, sufficient for a 10 µM solution once resuspended using protocol below. Suitable for 50-100 transfections. Also see CRABP-II shRNA Plasmid (h): sc-35105-SH and CRABP-II shRNA (h) Lentiviral Particles: sc-35105-V as alternate gene silencing products.

For independent verification of CRABP-II (h) gene silencing results, we also provide the individual siRNA duplex components. Each is available as 3.3 nmol of lyophilized siRNA. These include: sc-35105A, sc-35105B and sc-35105C.

APPLICATIONS

CRABP-II siRNA (h) is recommended for the inhibition of CRABP-II expression in human cells.

SUPPORT REAGENTS

For optimal siRNA transfaction efficiency, Santa Cruz Biotechnology’s siRNA Transfection Reagent: sc-29528 (3.3 µM), siRNA Transfection Medium: sc-36888 (20 µl) and siRNA Dilution Buffer: sc-29527 (5 µl) are recommended. Control siRNAs or Fluorescein Conjugated Control siRNAs are available at 10 µM in 66 µl. Each contain a scrambled sequence that will not lead to the specific degradation of any known cellular mRNA. Fluorescein Conjugated Control siRNAs include: sc-36869, sc-44239, sc-44240 and sc-44241. Control siRNAs include: sc-37007, sc-44230, sc-44231, sc-44232, sc-44233, sc-44234, sc-44235, sc-44236, sc-44237 and sc-44238.

GENE EXPRESSION MONITORING

CRABP-I/II (F-9): sc-166897 is recommended as a control antibody for monitoring of CRABP-I gene expression knockdown by Western Blotting (starting dilution 1:200, dilution range 1:100-1:1000) or immunofluorescence (starting dilution 1:50, dilution range 1:50-1:500).

To ensure optimal results, the following support reagents are recommended: 1) Western Blotting: use m-IgG® BP-HRP: sc-516102 or m-IgG® BP-HRP (Cruz Marker): sc-516102-CM (dilution range: 1:1000-1:10000), Cruz Marker™ Molecular Weight Standards: sc-2035, UltraCruz® Blocking Reagent: sc-516214 and Western Blotting Luminol Reagent: sc-2048. 2) Immunofluorescence: use m-IgG® BP-RTIC: sc-516140 or m-IgG® BP-PE: sc-516141 (dilution range: 1:50-1:200) with UltraCruz® Mounting Medium: sc-24941 or UltraCruz® Hard-set Mounting Medium: sc-359850.

RT-PCR REAGENTS

Semi-quantitative RT-PCR may be performed to monitor CRABP-II gene expression knockdown using RT-PCR Primer: CRABP-II (h)-PR: sc-35105-PR (20 µl, 431 bp). Annealing temperature for the primers should be 55-60° C.
