

# UltraCruz Cattle Copper Bolus™

*your partner for a healthy herd*

A powerful dose of Copper Oxide in bolus form to help maintain healthy levels of copper in your cattle's diet, ensuring healthy growth and fertility. Available for both calves and adult cattle.

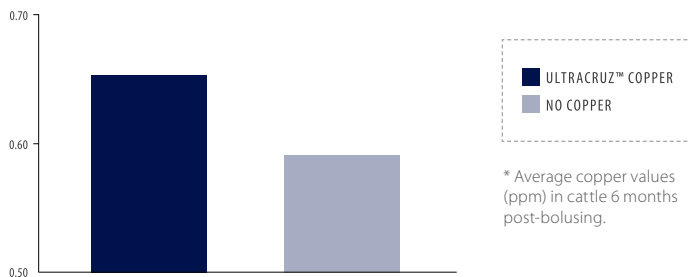

# UltraCruz Cattle Copper Bolus™

*Provides a Slow-Release Source of Copper*

Copper is a very important component of the everyday diet of cattle. It allows the body to absorb and utilize iron, works with Vitamin C to form a vital component of muscle (elastin), assists with the formation of bone structure and red blood cells, and is involved in many other everyday anatomical processes. When cattle don't get enough of this vital trace mineral, many problems can ensue. Anemia, weak bones and malfunction of the arterial walls are some of the most commonly seen effects. Deficiency is an incredibly common problem that can be caused by a number of factors, including copper-deficient diets (such as alfalfa), water with abnormally high levels of sulfur (which reduces the availability of copper in the body) or a lack of copper supplementation in copper-deficient regions. Our **UltraCruz Cattle Copper Bolus for Adults™** and **UltraCruz Cattle Copper Bolus for Calves™** ensures that your herd is getting the perfect amount of copper to keep them strong and healthy.

***That's the UltraCruz™ Advantage!***

## INGREDIENTS

(per recommended calf dosage—1 bolus, 12.5 g): Copper Oxide (12.5 g)  
(per recommended cattle dosage—1 bolus, 25 g): Copper Oxide (25 g)

## RECOMMENDATIONS FOR USE:

Calves 150–500 pounds body weight and over 3 months of age: 1 (12.5 g) capsule.  
Cattle over 500 pounds body weight: 1 (25 g) capsule.  
For adult cattle in situations of very low copper status: 2 (25 g) capsules.  
*A single dose typically lasts 8 months to 1 year.*

Administer the capsule orally with a suitable balling gun. To be effective, capsules must be swallowed. Administer only intact capsules. Do not crush or break. Do not administer to cattle of unknown copper status or those supplemented with other sources of copper. Do not administer to newborn calves. Copper toxicity in neonates has been reported. Do not use in cattle suffering from jaundice or any other liver disorder. Under most conditions, readministration will not be necessary for at least 12 months. Excessive levels of molybdenum, selenium, sulfur or iron in feed or water may impair copper absorption.

**Available only from Santa Cruz Animal Health.**
