**BACKGROUND**

FUCA1 (fucosidase, α-L-1, tissue) is a 466 amino acid membrane and seminal-associated isozyme that is a member of the glycosyl hydrolase 29 family. FUCA1 functions as a homotrimer and is responsible for hydrolyzing and reducing the carbohydrate moieties of glycoproteins in various tissues. Defects in the gene encoding FUCA1 result in fucosidosis, an autosomal recessive disorder caused by an accumulation of fucose-containing glycolipids and glycoproteins. Fucosidosis, a lysosomal storage disease, is characterized by neurologic deterioration, growth retardation, visceromegaly and seizures. Early onset of fucosidosis causes coarse facial features, angiokeratoma corporis diffusum, spasticity, delayed psychomotor development and an unusual spondylometaphyseal dysplasia.
