ETEA (F-7): sc-374098

BACKGROUND
ETEA, also designated UB domain-containing protein 8 (UBXD8), is a 445 amino acid protein associated with atopic dermatitis (AD), a chronic, non-contagious, relapsing, inflammatory skin disease characterized by eczematous skin lesions also referred to as eczematous dermatitis. Other atopic diseases such as hay fever, asthma and conjunctivitis often occur along with AD. ETEA shows higher expression in T cells and eosinophils of patients with AD than in T cells and eosinophils of unaffected individuals. T cells are influential in the regulation of the inflammatory process of this disease. The persistence of AD is attributed to dysregulated apoptosis in T cells, eosinophils and keratinocytes. ETEA may be involved in the resistance to apoptosis in T cells and eosinophils of AD patients.
