HD-PTP (F-4): sc-398711

BACKGROUND

HD-PTP (tyrosine-protein phosphatase non-receptor type 23, PTPN23) is a 1,636 amino acid protein encoded by the human gene PTPN23. HD-PTP belongs to the protein-tyrosine phosphatase family, non-receptor class subfamily. It contains one BRO1 domain, two TPR repeats and one tyrosine-protein phosphatase domain. The C-terminal region contains the PTP-like domain, whereas the N-terminal region contains the two TPR regions. These regions are homologous to the yeast protein, BRO1, which is involved in the mitogen-activated protein kinase signaling pathway. Similarly, HD-PTP is believed to act as a negative regulator of Ras-mediated mitogenicity and is phosphorylated upon DNA damage, probably by ATM or ATR. HD-PTP protein is differentially modulated by two angiogenic growth factors. While vascular endothelial growth factor (VEGF) has no affect on protein levels, protein is differentially modulated by two angiogenic growth factors. While vascular endothelial growth factor (VEGF) has no affect on protein levels, protein is differentially modulated by two angiogenic growth factors.
