SLC5A12 (H-4): sc-515141

BACKGROUND
SLC5A12 (solute carrier family 5 (sodium/glucose cotransporter), member 12), also known as SMCT2, is a 618 amino acid multi-pass membrane protein that belongs to the sodium:solute symporter (SSF) family. Considered an electroneutral and low-affinity sodium (Na+) dependent sodium-coupled solute transporter, SLC5A12 mediates the transport of a variety of monocarboxylates, including short-chain fatty acids, lactate, nicotinate and pyruvate. SLC5A12 is thought to participate in the initial step of reabsorption of monocarboxylates from the lumen of the proximal tubule of kidney and small intestine. It is also suggested that SLC5A12 plays a role in the transport of monocarboxylates in retina and is strongly inhibited by ibuprofen, fenoprofen and ketoprofen. SLC5A12 exists as two alternatively spliced isoforms and is encoded by a gene located on human chromosome 11p14.2.
