**BPDE-DNA (5D11): sc-52625**

### BACKGROUND

Benzo(a)pyrene-7,8-diol-9,10-epoxide (BPDE) is a five-ring polycyclic aromatic hydrocarbon that is mutagenic and highly carcinogenic. BPDE is a product of incomplete combustion found in coal tar, automobile exhaust fumes, tobacco smoke, and in charbroiled food. BPDE is first activated by cytochrome P4501A1 to form + -benzo[a]pyrene, 7,8-oxide which is then metabolized by epoxide hydrolase to yield [-]-benzo[a]pyrene-7,8,diol diol. This product forms the ultimate carcinogen after reacting with cytochrome P4501A1 to yield benzopyrene dial epoxide. The two carbons of the epoxide are electron-rich, and this molecule intercalates and distorts DNA, covalently bonding to the nucleophilic guanine nucleobases at the N2 position. BPDE causes an increased number of micronuclei and apoptosis in cells and eventually causes many types of cancer, especially lung.
