HSV-1 ICP4 (H943): sc-69809

BACKGROUND
Infected-cell polypeptide 4 (ICP4) of herpes simplex virus type 1 (HSV-1) is one of five immediate early transcriptional regulatory proteins produced promptly upon infection. ICP4 is required for the adequate transcription of early and late viral genes. Necessary for viral growth, ICP4 Immediate early protein functions to amplify the rates of transcription of viral genes during viral infection by activating gene expression. ICP4 Immediate early protein also initiates transcription in reconstituted transcription reactions. By either increasing or decreasing the rate of formation of transcription initiation complexes mediated by RNA polymerase II, transcription is activated through a set of general transcription factors (GTFs). ICP4 immediate early protein specifically promotes transcription PIC (preinitiation complexes) formation by increasing the binding of TFIIID to the TATA box. Data suggests that upon infection, the ICP4 protein also retains a critical role in directing the endless looped conformation of the HSV-1 genome.

REFERENCES

SOURCE
HSV-1 ICP4 (H943) is a mouse monoclonal antibody raised against herpes virus.

PRODUCT
Each vial contains 100 µg IgG1 in 1.0 ml PBS with < 0.1% sodium azide and 0.1% gelatin.

STORAGE
Store at 4° C, **DO NOT FREEZE**. Stable for one year from the date of shipment. Non-hazardous. No MSDS required.

APPLICATIONS
HSV-1 ICP4 (H943) is recommended for detection of ICP4 of HSV-1 origin by Western Blotting (starting dilution 1:200, dilution range 1:100-1:1000) and immunofluorescence (starting dilution 1:50, dilution range 1:50-1:500).

Molecular Weight of HSV-1 ICP4: 175 kDa.
