BACKGROUND

Eukaryotes produce three distinct classes of RNA polymerase, Pol I, II and III. Each polymerase is responsible for the synthesis of a different class of RNA. RNA polymerase III (Pol III) transcribes the SS rRNA genes and all of the tRNA (transfer RNA) genes. POLR3D, also known as DNA-directed RNA polymerase III subunit RPC4 and Protein BN51, is a 398 amino acid nuclear protein that is one of the seventeen subunits that comprise Pol III. Specifically, POLR3D is a DNA-dependent RNA polymerase that uses the four ribonucleoside triphosphates to catalyze the transcription of DNA to RNA. The gene encoding POLR3D maps to human chromosome 8, which is made up of nearly 146 million bases and encodes about 800 genes.
